A WARNING

Improper installation, adjustment, alteration, service or maintenance can cause property damage, personal injury or loss of life. Installation and service must be performed by a licensed professional HVAC installer or equivalent, service agency, or the gas supplier

R-454B

To prevent serious injury or death:

- 1- Lock-out/tag-out before performing maintenance.
- 2- If system power is required (e.g., smoke detector maintenance), disable power to blower, remove fan belt where applicable, and ensure all controllers and thermostats are set to the "OFF" position before performing maintenance.
- 3- Always keep hands, hair, clothing, jewelry, tools, etc., away from moving parts.

RETAIN THESE INSTRUCTIONS FOR FUTURE REFERENCE

Attention!

Use this QR code to download the mobile service app. Follow the prompts to pair the app with the Unit Controller. Refer to the "Mobile Service App" section in this manual. The QR code is also available in the unit control area.

The app can be downloaded from the appropriate iOS or Android store. Look for the following icon.

As with any mechanical equipment, contact with sharp sheet metal edges can result in personal in jury. Take care while handling this equipment and wear gloves and protective clothing.

WARNING

Only manufacturer approved auxiliary devices are permitted to be installed in this unit.

A WARNING

If this appliance is conditioning a space with an area smaller than TAmin or stored in a space with an area smaller than Amin as defined by this instruction, then that space must be without continuously operating open flames (e.g. an operating gas appliance) or other potential ignition sources (e.g. an operating electric heater or similar hot surface). A flame-producing device may be installed in the same space if the device is provided with an effective flame arrest system.

•Do not use means to accelerate the defrosting process or to clean, other than those recommended by the manufacturer.

•The appliance shall be stored in a room without continuously operating ignition sources (for example: open flames, an operating gas appliance, or an operating electric heater).

•Do not pierce or burn.

•Be aware that refrigerants may not contain an odor.

Auxiliary devices which may be a potential ignition source shall not be installed in the duct work. Examples of such potential ignition sources are hot surfaces with a temperature exceeding 700°C and electric switching devices.

Any personnel installing, decommissioning, or performaing maintenance on the unit must be properly trained with A2L refrigerants.

Leak Detection System installed. Unit must be powered except for service.

Servicing shall be performed only as recommended by the manufacturer.

A WARNING

•This appliance must be installed in accordance with local and national wiring regulations.

•If the appliance is not fitted with an option for full disconnection from power, a means of disconnection must be incorporated in the fixed wiring in accordance with national and local wiring regulations.

A WARNING

Ducts connected to an appliance shall not contain a potential ignition source.

A CAUTION

The appliance is not to be used by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction

A CAUTION

Children should be supervised not to play with the appliance.

Pipe work, including piping material, pipe routing, and installation shall include protection from physical damage in operation and service, and be in compliance with national and local codes and standards, such as ASHRAE 15, ASHRAE 15.2, IAPMO Uniform Mechanical Code, ICC International Mechanical Code, or CSA B52. All field joints shall be accessible for inspection prior to being covered or enclosed.

Refrigerant sensors for refrigerant detection systems shall only be replaced with sensors specified by the appliance manufacture.

A CAUTION

This unit is equipped with electrically powered safety measures. To be effective, the unit must be electrically powered at all times after installation, other than when servicing.

A2L Refrigerant Considerations

Ensure that the area is in the open or that it is adequately ventilated before breaking into the system or conducting any hot work. A degree of ventilation shall continue during the period that the work is carried out. The ventilation should safely disperse any released refrigerant and preferably expel it externally into the atmosphere.

Check that cabling will not be subject to wear, corrosion, excessive pressure, vibration, sharp edges or any other adverse environmental effects, taking into account the effects of aging or continual vibration from sources such as compressors or fans.

Under no circumstances shall potential sources of ignition be used when searching for or detecting refrigerant leaks. A halide torch (or any other detector using a naked flame) shall not be used. Electronic leak detectors may be used to detect refrigerant leaks but, in the case of flammable refrigerants, the sensitivity may not be adequate, or may need re-calibration.

(Detection equipment shall be calibrated in a refrigerantfree area.) Ensure that the detector is not a potential source of ignition and is suitable for the refrigerant used. Leak detection equipment shall be set at a percentage of the LFL of the refrigerant and shall be calibrated to the refrigerant employed, and the appropriate percentage of gas (25 % maximum) is confirmed. Leak detection fluids are also suitable for use with most refrigerants but the use of detergents containing chlorine shall be avoided as the chlorine may react with the refrigerant and corrode the copper pipe-work. If a leak is suspected, all naked flames shall be removed/extinguished. If a leakage of refrigerant is found which requires brazing, all of the refrigerant shall be recovered from the system, or isolated (by means of shut off valves) in a part of the system remote from the leak.

When breaking into the refrigerant circuit to make repairs – or for any other purpose – conventional procedures shall be used. However, for flammable refrigerants it is important that best practices be followed since flammability is a consideration. The following procedure shall be adhered to:

-Safely remove refrigerant following local and national regulations.

-Evacuate the circuit.

-Purge the circuit with inert gas.

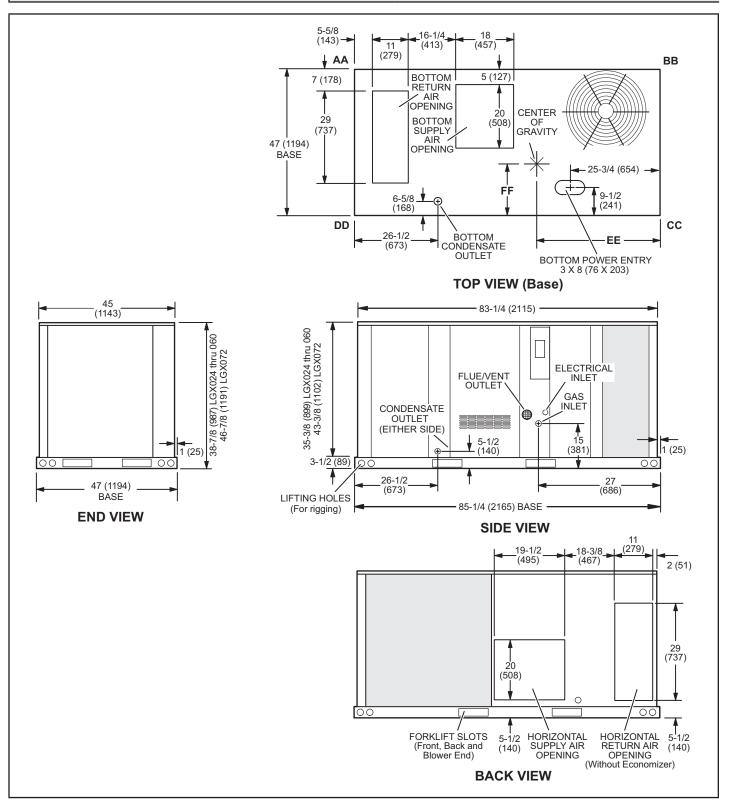

-Evacuate.

-Purge the circuit with inert gas.

-Open the circuit

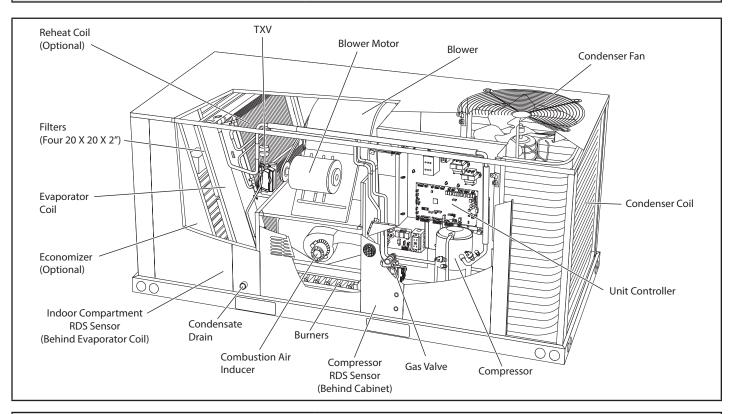

The refrigerant charge shall be recovered into the correct recovery cylinders if venting is not allowed by local and national codes. For appliances containing flammable refrigerants, the system shall be purged with oxygenfree nitrogen to render the appliance safe for flammable refrigerants. This process might need to be repeated several times. Compressed air or oxygen shall not be used for purging refrigerant systems. Refrigerants purging shall be achieved by breaking the vacuum in the system with oxygen-free nitrogen and continuing to fill until the working pressure is achieved, then venting to atmosphere, and finally pulling down to a vacuum. This process shall be vented down to atmospheric pressure to enable work to take place. Ensure that the outlet for the vacuum pump is not close to any potential ignition sources and that ventilation is available.

Shipping and Packing List

Package 1 of 1 contains:

1 - Assembled unit

Check unit for shipping damage. Receiving party should contact last carrier immediately if shipping damage is found.

General

These instructions are intended as a general guide and do not supersede local codes in any way. Authorities having jurisdiction should be consulted before installation.

The LGX units are available in several heating inputs. The LCX cooling packaged rooftop unit is the same basic design as the LGX unit except for the heating section. Optional electric heat is available for LCX units. LGX and LCX units have identical refrigerant circuits with respective 2, 3, 4, 5, and 6 ton cooling capacities.

Units are equipped with all-aluminum condenser coils. Units are equipped with two-speed compressors.

In addition to standard heating and cooling, hot gas reheat units provide a dehumidifying mode of operation. Refer to Reheat Operation section.

Availability of units and options varies by brand.

•Auxiliary devices which may be a potential ignition source shall not be installed in the duct work. Examples of such potential ignition sources are hot surfaces with a temperature exceeding 700°C and electric switching devices.

•False ceilings or drop ceiling may be used as a return air plenum only if the unit being installed has a Refrigerant Detection System installed.

Requirements

See FIGURE 1 for unit clearances.

IMPORTANT

The Clean Air Act of 1990 bans the intentional venting of refrigerant (CFC's and HCFC's) as of July 1, 1992. Approved methods of recovery, recycling or reclaiming must be followed. Fines and/or incarceration may be levied for non-compliance.

Electric shock hazard and danger of explosion. Can cause injury, death or product or property damage. Turn off gas and electrical power to unit before performing any maintenance or servicing operations on the unit. Follow lighting instructions attached to unit when putting unit back into operation and after service or maintenance.

Roof Damage!

This system contains both refrigerant and oil. Some rubber roofing material may absorb oil, causing the rubber to swell. Bubbles in the rubber roofing material can cause leaks. Protect the roof surface to avoid exposure to refrigerant and oil during service and installation. Failure to follow this notice could result in damage to roof surface.

ation Clearance	(914)	(914)	(914)	(914)	structed

NOTE - Entire perimeter of unit base requires support when elevated above mounting surface.

¹ Service Clearance - Required for removal of serviceable parts. Clearance to Combustibles - Required clearance to combustible material (gas units). On LCT units, see clearance to combustible materials as outlined on heater rating plate.

Minimum Operation Clearance - Required clearance for proper unit operation.

Minimum R454B Space and CFM Requirements

Minimum Airflow ¹					
Unit	Q _{min} (CFM)	Q _{min} (m³h)			
LCX/LGX024	103	174			
LCX/LGX036	98	166			
LCX/LGX048	93	157			
LCX/LGX060	99	168			
LCX/LGX072	137	233			
LCX/LGX024 W/ Humidtrol	113	191			
LCX/LGX036 W/ Humidtrol	123	208			
LCX/LGX048 W/ Humidtrol	112	190			
LCX/LGX060 W/ Humidtrol	126	214			
LCX/LGX072 W/ Humidtrol	119	202			

Refrigerant Charge R-454B					
Unit	M _c (lbs)	M _c (kg)			
LCX/LGX024	3.88	1.76			
LCX/LGX036	3.69	1.67			
LCX/LGX048	3.50	1.59			
LCX/LGX060	3.75	1.70			
LCX/LGX072	5.19	2.35			
LCX/LGX024 W/ Humidtrol	4.26	1.93			
LCX/LGX036 W/ Humidtrol	4.64	2.10			
LCX/LGX048 W/ Humidtrol	4.24	1.92			
LCX/LGX060 W/ Humidtrol	4.76	2.16			
LCX/LGX072 W/ Humidtrol	4.50	2.04			

¹ **NOTE -** The minimum airflow is the lowest CFM allowed during venting operation (leak mitigation).

Minimum Room Area of Conditioned Space ²					
Unit	$TA_{min}(ft^2)$	$TA_{min}(m^2)$			
LCX/LGX024	57	5.3			
LCX/LGX036	55	5.0			
LCX/LGX048	52	4.8			
LCX/LGX060	55	5.1			
LCX/LGX072	77	7.1			
LCX/LGX024 W/ Humidtrol	63	5.8			
LCX/LGX036 W/ Humidtrol	68	6.3			
LCX/LGX048 W/ Humidtrol	63	5.8			
LCX/LGX060 W/ Humidtrol	70	6.5			
LCX/LGX072 W/ Humidtrol	66	6.1			

² **NOTE -** The minimum room area of conditioned space is the smallest area the unit can service.

	Altitude Adjustment Factor ³								
Halt	0	200	400	600	800	1000	1200	1400	1600
AF	1	1	1	1	1.05	1.05	1.04	1.1	1.12
Halt	1600	1800	2000	2200	2400	2600	2800	3000	3200
AF	1.12	1.15	1.18	1.21	1.25	1.28	1.32	1.36	1.40

³ **NOTE** - Use the Altitude Adjustment Factor to adjust the values in the tables above to different altitudes. Find the relevant altitude above sea level in the two "Halt" rows and then multiply the value needed from the tables above by the altitude factor number. Example: For the minimum airflow in CFM for an LCX/LGX024 at 1000 ft. above see level, multiply 103 by 1.05 to get 108.15 CFM as the new Q_{min} .

Use of this unit as a construction heater or air conditioner is not recommended during any phase of construction. Very low return air temperatures, harmful vapors and operation of the unit with clogged or misplaced filters will damage the unit.

If this unit has been used for heating or cooling of buildings or structures under construction, the following conditions must be met or the warranty will be void:

- A room thermostat must control the unit. The use of fixed jumpers that will provide continuous heating or cooling is not allowed.
- A pre-filter must be installed at the entry to the return air duct.
- The return air duct must be provided and sealed to the unit.
- Return air temperature range between 55°F (13°C) and 80°F (27°C) must be maintained.
- Air filters must be replaced and pre-filters must be removed upon construction completion.
- The input rate and temperature rise must be set per the unit rating plate.
- The heat exchanger, components, duct system, air filters and evaporator coil must be thoroughly cleaned following final construction clean-up.
- The unit operating conditions (including airflow, cooling operation, ignition, input rate, temperature rise and venting) must be verified according to these installation instructions.

This appliance is not intended for use by persons (including children) with reduced physical, sensory, or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.

Unit Support

In downflow discharge installations, install the unit on a non-combustible surface only. Unit may be installed on combustible surfaces when used in horizontal discharge applications or in downflow discharge applications when installed on an T1CURB / C1CURB / E1CURB roof mounting frame.

NOTE - Securely fasten roof frame to roof per local codes

A CAUTION

To reduce the likelihood of supply / return air bypass and promote a proper seal with the RTU, duct work / duct drops / diffuser assemblies must be supported independently to the building structure.

A-Downflow Discharge Application

Roof Mounting with T1CURB / C1CURB / E1CURB

- 1 The roof mounting frame must be installed, flashed and sealed in accordance with the instructions provided with the frame.
- 2 The roof mounting frame should be square and level to 1/16" per linear foot (5mm per linear meter) in any direction.
- 3 Duct must be attached to the roof mounting frame and not to the unit; supply and return plenums must be installed before setting the unit.

Installer's Roof Mounting Frame

Many types of roof frames can be used to install the unit depending upon different roof structures. Items to keep in mind when using the building frame or supports are:

- 1 The base is fully enclosed and insulated, so an enclosed frame is not required.
- 2 The frames or supports must be constructed with non-combustible materials and should be square and level to 1/16" per linear foot (5mm per linear meter) in any direction.
- 3 Frame or supports must be high enough to prevent any form of moisture from entering unit. Recommended minimum frame height is 14" (356mm).
- 4 Duct must be attached to the roof mounting frame and not to the unit. Supply and return plenums must be installed before setting the unit.
- 5 Units require support along all four sides of unit base. Supports must be constructed of steel or suitably treated wood materials.

NOTE - When installing a unit on a combustible surface for downflow discharge applications, a T1CURB / C1CURB / E1CURB roof mounting frame is required.

B-Horizontal Discharge Applications

- 1 Units which are equipped with an optional economizer and installed in horizontal airflow applications must use a horizontal conversion kit.
- 2 Specified installation clearances must be maintained when installing units. Refer to FIGURE 1.
- 3 Top of support slab should be approximately 4" (102mm) above the finished grade and located so no run-off water from higher ground can collect around the unit.
- 4 Units require support along all four sides of unit base. Supports must be constructed of steel or suitably treated wood materials.

Duct Connection

All exterior ducts, joints and openings in roof or building walls must be insulated and weather-proofed with flashing and sealing compounds in accordance with applicable codes. Any duct passing through an unconditioned space must be insulated.

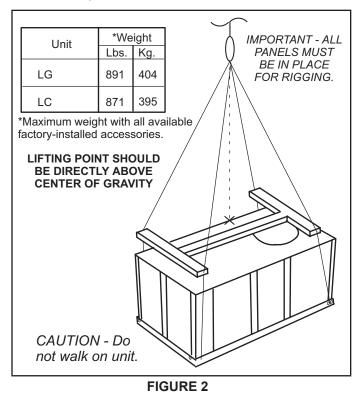

A CAUTION

In downflow applications, do not drill or punch holes in base of unit. Leaking in roof may occur if unit base is punctured.

Rigging Unit for Lifting

Rig unit for lifting by attaching four cables to holes in unit base rail. See FIGURE 2.

- 1 Detach wooden base protection before rigging.
- 2 Remove all six base protection brackets before setting unit.
- 3 Connect rigging to the unit base using both holes in each corner.
- 4 All panels must be in place for rigging.
- 5 Place field-provided H-style pick in place just above top edge of unit. Frame must be of adequate strength and length. (H-style pick prevents damage to unit.)

Horizontal Air Discharge

Unit is shipped with panels covering the horizontal supply and return air openings. Remove horizontal covers and place over downflow openings for horizontal air discharge. See FIGURE 3. Secure in place with sheet metal screws.

Units Equipped With An Optional Economizer

- Remove the horizontal supply air cover and position over the downflow supply air opening. Secure with sheet metal screws.
- 2 Leave the horizontal return air cover in place.
- 3 Locate the separately ordered horizontal air discharge kit. Place the kit panel over the downflow return air opening.
- 4 Remove and retain the barometric relief dampers and lower hood.

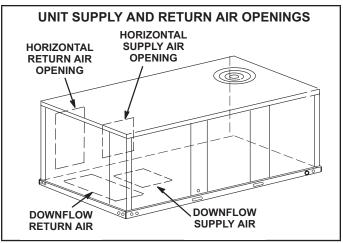

FIGURE 3

5 - Install return air duct beneath outdoor air intake. See FIGURE 4. Install barometric relief damper in lower hood and install in ductwork as shown in FIGURE 4.

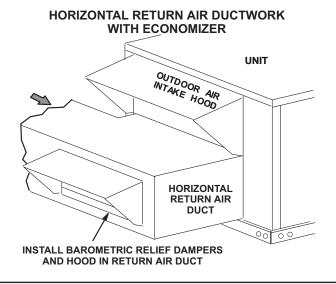

FIGURE 4

Condensate Drains

Make drain connection to the drain coupling provided on unit. Older model units have a 3/4" N.P.T. coupling and newer model units have a 1" N.P.T. coupling.

NOTE - The drain pan is made with a glass reinforced engineered plastic capable of withstanding typical joint torgue but can be damaged with excessive force. Tighten pipe nipple hand tight and turn an additional guarter turn.

A trap must be installed between drain connection and an open vent for proper condensate removal. See FIGURE 5 or FIGURE 6. It is sometimes acceptable to drain condensate onto the roof or grade; however, a tee should be fitted to the trap to direct condensate downward. The condensate line must be vented. Check local codes concerning condensate disposal. Refer to page 3 and page 4 for condensate drain location.

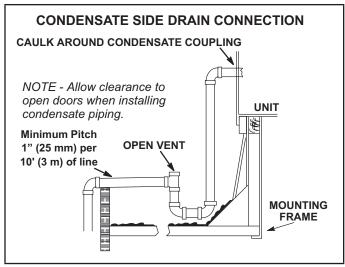

FIGURE 5

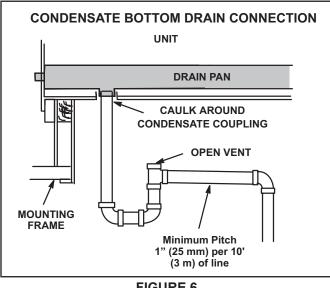

FIGURE 6

Units are shipped with the drain coupling facing the front of the unit. Condensate can be drained from the back or bottom of the unit with the following modifications. The unit can be installed in either downflow or horizontal air discharge regardless of condensate drain location.

Rear Drain Connection

1 - Remove the condensate drain mullion. See FIGURE 7. Remove the two panels on each side of the mullion.

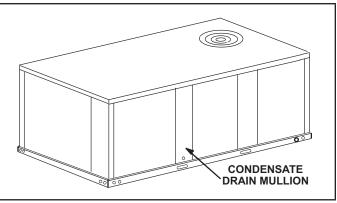

FIGURE 7

Two hinge screws must be removed in addition to the mullion screws. See FIGURE 8.

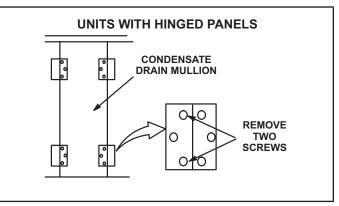

FIGURE 8

2 - Lift the front edge of the drain pan and slide pan out of unit. See FIGURE 9.

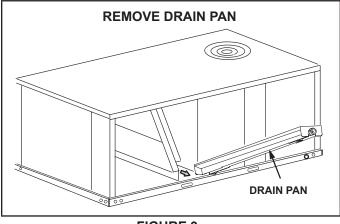

FIGURE 9

- 3 Make sure the cap over the unit bottom drain hole is secure.
- 4 Rotate the drain pan until the downward slope is toward the back of the unit. Slide the drain pan back into the unit. Be careful not to dislodge the cap over the bottom drain hole.
- 5 From the back side of the unit, pull the drain pan coupling through the rear condensate opening.
- 6 Replace the condensate drain mullion.

Bottom Drain Connection

- 1 Remove the condensate drain mullion. See FIGURE 7.
- 2 Lift the front edge of the drain pan and slide pan out of unit. See FIGURE 9.
- 3 Turn the drain pan upside down and drill a pilot hole through the bottom of the drain pan in the center of the coupling. See FIGURE 10.

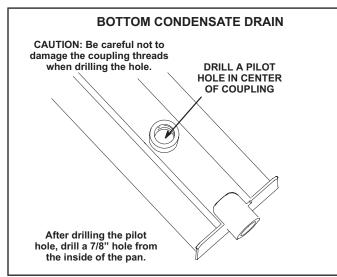

FIGURE 10

- 4 From the inside of the pan, use a Vari-Bit® bit to enlarge the hole to 7/8". Do not damage coupling threads.
- 5 Remove the cap over the unit bottom drain hole.
- 6 Slide the drain pan back into the unit.
- 7 From the back side of the unit, pull the drain pan coupling through the rear condensate opening.
- 8 From the front side of the unit, move the drain pan until the bottom coupling settles into the unit bottom drain opening. Once in place, check to make sure the coupling is still positioned through the rear condensate drain hole.
- 9 Use a field-provided 3/4" plug to seal side drain connection.
- 10 Replace the condensate drain mullion.

Connect Gas Piping (Gas Units)

Before connecting field-provided piping, check with gas company or authorities having jurisdiction for local code requirements. When installing gas supply piping, length of run from gas meter must be considered in determining pipe size for 0.5" w.c. (.12kPa) maximum pressure drop. Do not use supply pipe smaller than unit gas connection. Operating pressures at the unit gas connection must be as shown in TABLE 1.

TABLE 1 OPERATING PRESSURE AT GAS CONNECTON

"w.c.

	Natura	al Gas	LP/Prop	ane Gas
	Min. Max.		Min.	Max.
036-072	4.5	10.5	11	13

When making piping connections a drip leg should be installed on vertical pipe runs to serve as a trap for sediment or condensate. A 1/8" N.P.T. plugged tap is located on gas valve for test gauge connection. Refer to Heating Start-Up section for tap location. Install a ground joint union between the gas control manifold and the main manual shut-off valve. See FIGURE 11 for gas supply piping entering outside the unit. FIGURE 12 shows complete bottom gas entry piping.

Compounds used on threaded joints of gas piping shall be resistant to the action of liquefied petroleum gases.

Do not use Teflon® tape to seal gas piping. Use a moderate amount of pipe compound on the gas pipe only. Make sure the two end threads are bare.

If a flexible gas connector is required or allowed by the authority that has jurisdiction, black iron pipe shall be installed at the gas valve and extend outside the furnace cabinet.

A WARNING

Do not exceed 600 in-lbs (50 ft.-lbs) torque when attaching the gas piping to the gas valve.

IMPORTANT

Compounds used on threaded joints of gas piping must be resistant to the actions of liquefied petroleum gases.

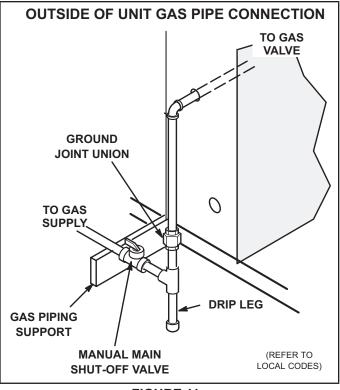

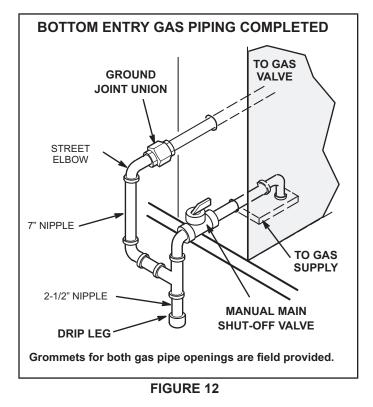

FIGURE 11

Pressure Test Gas Piping (Gas Units)

When pressure testing gas lines, the gas valve must be disconnected and isolated. Gas valves can be damaged if subjected to more than 0.5 psig (3.48kPa). See FIGURE 13.

NOTE - Codes may require that manual main shut-off valve and union (furnished by installer) be installed in gas line external to unit. Union must be of the ground joint type.

After all connections have been made, check all piping connections for gas leaks. Also check existing unit gas connections up to the gas valve; loosening may occur during installation. Use a leak detection solution or other preferred means. Do not use matches, candles, or other sources of ignition to check for gas leaks.

A CAUTION

Some soaps used for leak detection are corrosive to certain metals. Carefully rinse piping thoroughly after leak test has been completed. Do not use matches, candles, flame or other sources of ignition to check for gas leaks.

A WARNING

Danger of explosion. Can cause injury or product or property damage. Do not use matches, candles, flame or other sources of ignition to check for leaks.

NOTE - In case emergency shut down is required, turn off the main manual shut-off valve and disconnect main power to unit. These devices should be properly labeled by the installer.

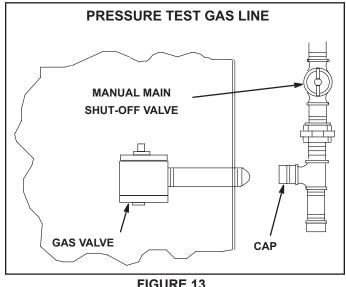

FIGURE 13

High Altitude Derate

Locate the high altitude conversion sticker in the unit literature bag. Fill out the conversion sticker and affix next to the unit nameplate. High altitude kits are available for field-installation.

Refer to TABLE 2 for high altitude adjustments.

TABLE 2 HIGH ALTITUDE DERATE

Altitude Ft.*	Gas manifold Pressure		
2000-4500	See Unit Nameplate		
4500 and Above	Derate 2% / 1000 Ft. above Sea Level		

*Units installed at 0-2000 feet do not need to be modified.

NOTE - This is the only permissible derate for these units.

Electrical Connections - Power Supply

Do not apply power or close disconnect switch until installation is complete. Refer to start-up directions. Refer closely to unit wiring diagram.

Refer to unit nameplate for minimum circuit ampacity and maximum fuse size.

1 - Units are factory-wired for 230 / 460 / 575 volt supply. For 208V supply, remove the insulated terminal cover from the 208V terminal on the control transformer. Move the wire from the transformer 240V terminal to the 208V terminal. Place the insulated terminal cover on the unused 240V terminal.

Route power through the bottom power entry area and connect to L1, L2, and L3 on the top of K1 in control area above compressor. Secure power wiring with factory-installed wire ties provided in control box. Route power to TB2 on units equipped with electric heat. Route power to S48 or CB10 If unit is equipped with the optional disconnect switch or circuit breaker. See unit wiring diagram.

Electrical Connections - Control Wiring

Connect either a thermostat, room/zone sensor, or direct digital controller; one of the three are required for unit function. Refer to the literature provided with each device and the following information.

NOTE - Optional wireless sensors are available for use with this unit. Refer to the instructions provided with each sensor.

Electrostatic discharge can affect electronic components. Take precautions during unit installation and service to protect the electronic controls. Precautions will help to avoid control exposure to electrostatic discharge by putting the unit, the control and the technician at the same electrostatic potential. Neutralize electrostatic charge by touching hands and all tools on an unpainted unit surface, such as the gas valve or blower deck, before performing any service procedure.

A-Thermostat Location

Room thermostat mounts vertically on a standard 2" X 4" handy box or on any non-conductive flat surface.

Locate thermostat approximately 5 feet (1524mm) above the floor in an area with good air circulation at average temperature. Avoid locating the room thermostat where it might be affected by:

- · drafts or dead spots behind doors and in corners
- hot or cold air from ducts
- radiant heat from sun or appliances
- · concealed pipes and chimneys

B-Control Wiring

The Unit Controller will operate the unit from a thermostat or zone sensor based on the System Mode. The default System Mode is the thermostat mode. Refer to the Unit Controller Setup Guide to change the System Mode. Use the mobile service app menu and select Settings > Install.

Thermostat Mode

1 - Route thermostat cable or wires from subbase to control area above compressor (refer to unit dimensions to locate bottom and side power entry).

IMPORTANT - Unless field thermostat wires are rated for maximum unit voltage, they must be routed away from line voltage wiring. Use wire ties located near the lower left corner of the controls mounting panel to secure thermostat cable. Use 18 AWG wire for all applications using remotely installed electro-mechanical and electronic thermostats.

2 - Install thermostat assembly in accordance with instructions provided with thermostat.

- 3 Connect thermostat wiring to Unit Controller on the lower side of the controls hat section.
- 4 Wire as shown in FIGURE 14 for electromechanical and electronic thermostats. If using other temperature control devices or energy management systems see instructions and wiring diagram provided by manufacturer.

IMPORTANT - Terminal connections at the wall plate or subbase must be made securely. Loose control wire connections may allow unit to operate but not with proper response to room demand.

Zone Sensor Mode

The Unit Controller will operate heating and cooling based on the Unit Controller internal setpoints and the temperature from the A2 zone sensor. An optional Network Control Panel (NCP) can also be used to provide setpoints. A thermostat or return air sensor can be used as a back-up mode. Make zone sensor wiring connections as shown in FIGURE 15.

C-Hot Gas Reheat

 Install humidity sensor in accordance with instructions provided with sensor. A DDC input may be used to initiate dehumidification instead of a sensor. 2 - Make wiring connections as shown in FIGURE 14 for Thermostat Mode or FIGURE 15 for Zone Sensor Mode. In addition, connect either a humidity sensor or a dehumidification input. See FIGURE 16 or FIGURE 18 for humidity sensor wiring or FIGURE 18 for dehumidification input wiring.

Humidity Sensor Cable Applications

Wire runs of 50 feet (mm) or less

Use two separate shielded cables containing 20AWG minimum, twisted pair conductors with overall shield. Belden type 8762 or 88760 (plenum) or equivalent. Connect both cable shield drain wires to the Unit Controller as shown in FIGURE 16.

Wire runs of 150 feet (mm) or less

Use two separate shielded cables containing 18AWG minimum, twisted pair conductors with overall shield. Belden type 8760 or 88760 (plenum) or equivalent. Connect both cable shield drain wires to the Unit Controller as shown in FIGURE 16.

Wire runs over 150 feet (mm)

Use a local, isolated 24VAC transformer such as Lennox cat #18M13 (20VA minimum) to supply power to RH sensor as shown in FIGURE 18. Use two shielded cables containing 20AWG minimum, twisted pair conductors with overall shield. Belden type 8762 or 88760 (plenum) or equivalent.

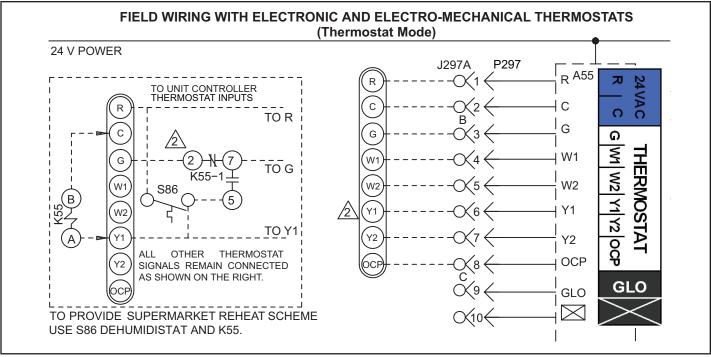

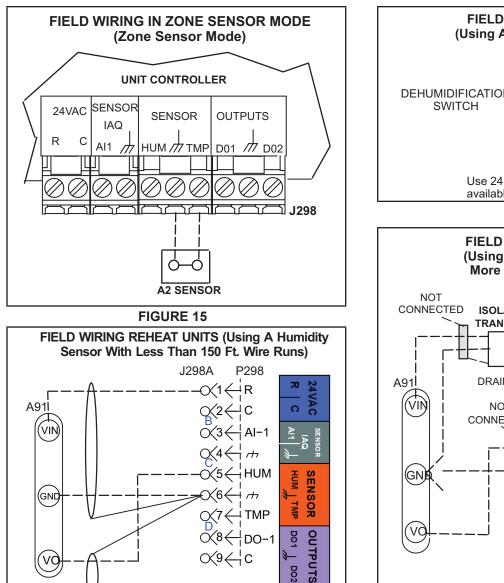

FIGURE 14

DO2

FIGURE 16

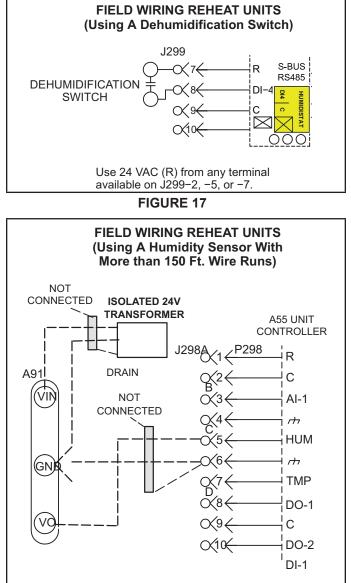

FIGURE 18

Mobile Service App

Setup and configure each rooftop unit using the mobile service app (Android or iOS devices supported).

A-Mobile Device Requirements

- Bluetooth connection.
- Android hardware requires 2GB RAM and a 2Ghz core processor. Tablets are supported.
- The app is available for both iOS 11.0 or higher (App Store) and Android 9.0 or higher (Google Play).

B-Download the App

Use your mobile device to scan the QR code from the cover page and download the mobile service app to your mobile device.

C-Pair the App to the Unit Controller

- 1 Apply power to the unit and wait until the Unit Controller has booted-up (approximately two minutes).
- 2 Press and hold the pair button for five seconds.
- 3 The unit (or list of units) will appear; select the appropriate unit. When the app code matches the four-character code on the Unit Controller display, the unit is paired (within 10 seconds). Note the following:
 - The app will list the units by signal strength; the RTU name will be displayed.
 - Once paired, the RTU name, model number, serial number and firmware version will be displayed.

Please refer to the manufacturer's website for additional technical information and self-help support.

D-App Menus

See FIGURE 19 for the menu overview. Follow the app prompts in the Install, Network Integration, and Test and Balance menus. Verify the app is setup properly for the unit application (including the date and time). Refer to FIGURE 20, FIGURE 21, and FIGURE 22.

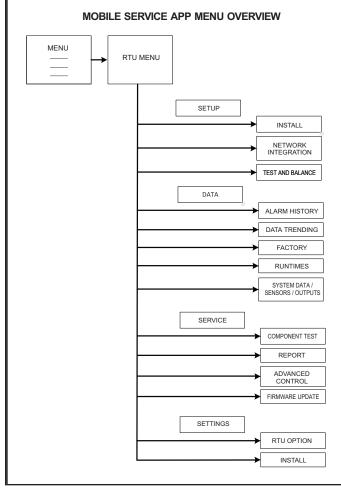

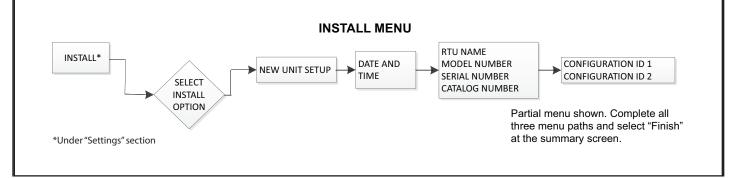

FIGURE 19

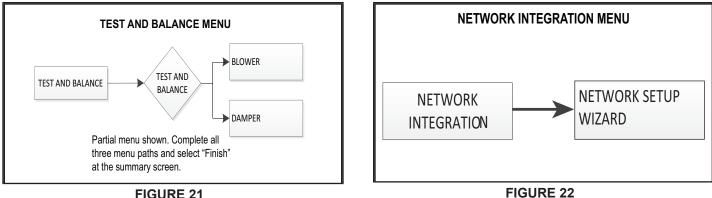

FIGURE 21

E-Unit Controller Components

See FIGURE 23 for Unit Controller components. See FIGURE 24 and TABLE 3 for pushbutton and LED functions.

UNIT CONTROLLER PUSHBUTTON CODES				
Code	Cause	Action		
CLdL	Black Button: Short Press	Clear Delays		
rSt	Black Button: Long Press	Reset		
tESt	White Button: Short Press	TSTAT Test		
StAt	White Button: Long Press (In Pre-Install state)	TSTAT Override		
tESt White Button: Long Press (NOT in TSTAT Test Pre-Install State)				
Short Press : 2 to 5 seconds.				
Long Press : 5 to 8 seconds.				

Blower Operation and Adjustments

Units are available with a variety of blower options. See TABLE 4.

BLOWER OF HONS				
LC 024, 030	Single-Stage, Direct Drive			
Single Phase LG 024, 030, 036, 048, 060	Multi-Stage, Direct Drive			
Three Phase LG/LC 036, 048, 060	Single-Stage, Direct Drive OR Belt Drive			
LGX/LCX 072 S4T	Two-Speed Belt Drive			

TABLE 4 BLOWER OPTIONS

LGX/LCX072S4T units are equipped with two-stage blowers. The blower will operate at high speed with a Y2 thermostat demand and low speed with a Y1 thermostat demand. Low speed operation delivers approximately 2/3 of the air volume of high speed. Two-speed blower operation results in lower energy consumption. On LGX/ LCX072S4T units equipped with hot gas reheat, the blower and compressor will operate on high speed during reheat operation.

A IMPORTANT

Three phase scroll compressors must be phased sequentially for correct compressor and blower rotation. Follow "COOLING START-UP" section of installation instructions to ensure proper compressor and blower operation.

A-Blower Operation

Initiate blower demand at thermostat according to instructions provided with thermostat. Unit will cycle on thermostat demand. The following steps apply to applications using a typical electro-mechanical thermostat.

 Blower operation is manually set at the thermostat sub-base fan switch. With fan switch in **ON** position, blowers will operate continuously. 2 - With fan switch in AUTO position, the blowers will cycle with demand. Blowers and entire unit will be off when system switch is in OFF position.

B-Determining Unit CFM - Single-Speed, Direct Drive Blowers

- 1 The following measurements must be made with air filters in place.
- 2 With all access panels in place, measure static pressure external to unit (from supply to return). Add any additional air resistance for options and accessories shown in accessory air resistance tables. Blower performance data is based on static pressure readings taken in locations shown in FIGURE 26.

NOTE - Static pressure readings can vary if not taken where shown.

3 - Use FIGURE 25 to determine the factory set blower speed.

Use direct drive blower tables, the measured static pressure and the factory-set blower speed to determine CFM. If CFM is lower or higher than the design specified CFM, move the leads as shown in FIGURE 27 for 208/230 volt units and FIGURE 28 for 460/575 volt units.

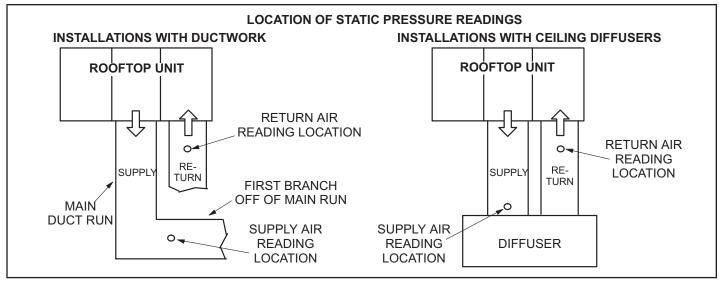

FIGURE 26

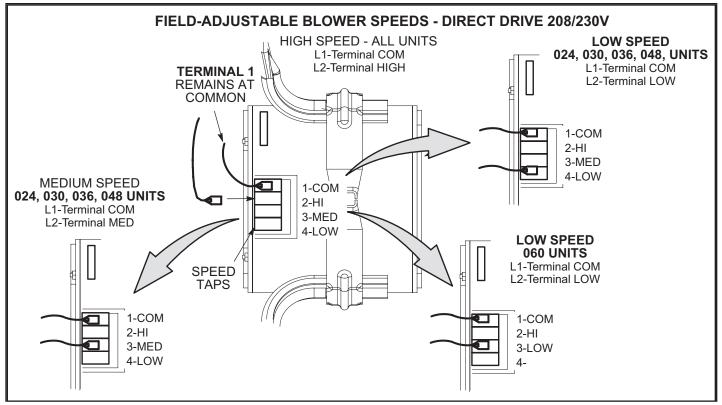

FIGURE 27

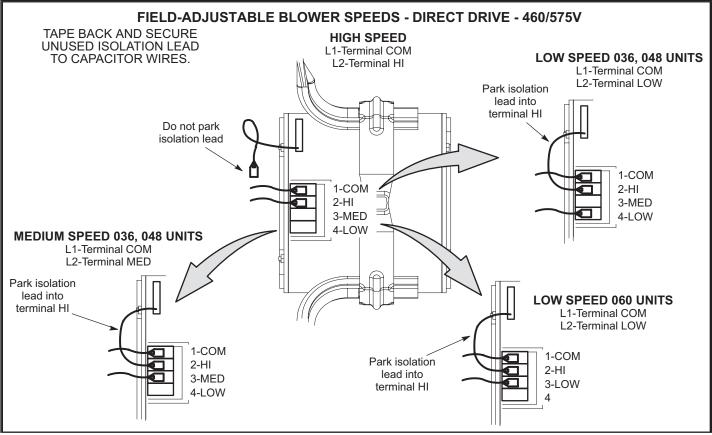

FIGURE 28

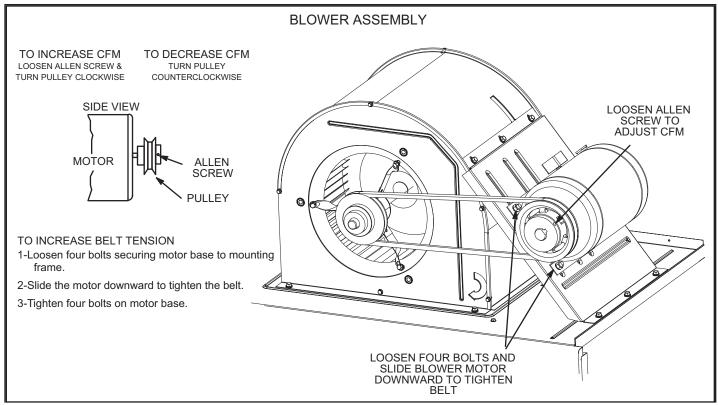

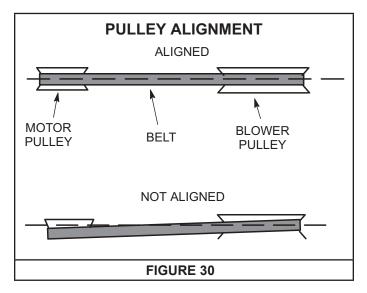

FIGURE 29

C-Blower Belt Adjustment

Maximum life and wear can be obtained from belts only if proper pulley alignment and belt tension are maintained. Tension new belts after a 24-48 hour period of operation. This will allow belt to stretch and seat grooves. Make sure blower and motor pulley are aligned as shown in FIGURE 30.

- 1 Loosen four bolts securing motor base to mounting frame. See FIGURE 29.
- 2 To increase belt tension Slide blower motor downward to tighten the belt. This increases the distance between the blower motor and the blower housing.
- 3 *To loosen belt tension* Slide blower motor upward to loosen the belt. This decreases the distance between the blower motor and the blower housing.
- 4 Tighten four bolts securing motor base to the mounting frame.

D-Adjusting Unit CFM

The supply CFM can be adjusted by changing Unit Controller settings. Refer to TABLE 5 for menu paths and default settings. Record any CFM changes on the parameter settings label located on the inside of the compressor access panel. IMPORTANT - The default value for Cooling Low CFM is lower than a traditional single or two-speed blower. If operating the unit with a 2 or 3-stage controller (2 or 3-stage thermostat, DDC controller, etc.), it is recommended to increase the Cooling Low CFM default value to a suitable level for part load cooling (typically 60% of full load CFM).

TABLE 5 BLOWER PERFORMANCE SETTINGS - 581102-01

Parameter	Field Setting	Description
NOTE - Any changes to Smoke CFM sett	ting must be adjus	ted before the other CFM settings. Use SETTINGS > RTU OP TIONS > EDIT PARAME-
TERS = 12 for EBM, 6 for ECM		
BLOWER SMOKE CFM	%	Percentage of torque for blower smoke speed.
SETUP > TEST & BALANCE > BLOWER	2	
BLOWER HEATING HIGH CFM	%	Percentage of torque for blower heating high speed.
BLOWER HEATING LOW CFM	%	Percentage of torque for blower heating low speed (P volt gas heat only).
BLOWER COOLING HIGH CFM	%	Percentage of torque for blower cooling high speed.
BLOWER COOLING LOW CFM	%	Percentage of torque for blower cooling low speed and vent speed for standard static blowers.
BLOWR VENTILATION CFM	%	Percentage of torque for high static blower ventilation speed.
SETUP > TEST & BALANCE > DAMPER	R	
BLOWER HIGH CFM DAMPER POS %	%	Minimum damper position for high speed blower operation. Default 0%.
BLOWER LOW CFM DAMPER POS %	%	Minimum damper position for low speed blower operation. Default 0%.
POWER EXHAUST DAMPER POS %	%	Minimum damper position for low power exhaust operation. Default 50%.
SETTINGS > RTU OPTIONS > EDIT PAR	RAMETERS = 216	
POWER EXHAUST DEADBAND %	%	Deadband % for power exhaust operation. Default 10%.
SETTINGS > RTU OPTIONS > EDIT PAR	RAMETERS = 10	Applies to Thermostat Mode ONLY)
FREE COOLING STAGE-UP DELAY	sec	Number of seconds to hold blower at low speed before switching to blower at high speed. Default 300 seconds.

Installer - Record any parameter changes under "Field Setting" column. Settings need to be recorded by installer for use when Unit Controller is replaced or reprogrammed.

LGX024S5E | LGX036S5E BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT ONLY WITH DRY INDOOR COIL AND AIR FILTERS IN PLACE. FOR ALL UNITS ADD:

#### LGX036S5D | LGX048S5D

#### BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT ONLY WITH DRY INDOOR COIL AND AIR FILTERS IN PLACE.

FOR ALL UNITS ADD:

1 - Any factory installed options air resistance (larger gas heat section, economizer, wet coil, etc.) See page 35.

2 - Any field installed accessories air resistance (duct resistance, diffuser, etc.) See page 35.

#### Minimum Air Volume Required For Different Gas Heat Sizes:

Standard Heat - 1075 cfm; Medium Heat - 1150 cfm; High Heat - 1500 cfm

# LGX072S5T

# BLOWER TABLE INCLUDES RESISTANCE FOR BASE UNIT ONLY WITH DRY INDOOR COIL AND AIR FILTERS IN PLACE.

FOR ALL UNITS ADD:

Any factory installed options air resistance (larger gas heat section, economizer, wet coil, etc.) See page 35.
 Any field installed accessories air resistance (duct resistance, diffuser, etc.) See page 35.

See page 35 for blower motors and drives.

Minimum Air Volume Required For Different Gas Heat Sizes:

Standard Heat - 1075 cfm; Medium Heat - 1150 cfm; High Heat - 1500 cfm

1 Effective throw based on terminal velocities of 75 ft. per minute.

#### **Refrigerant Leak Detection System**

#### A-System Test

1 - Initiate Refrigerant Leak Detection System Test by using the following mobile service app menu path:

#### RTU MENU > COMPONENT TEST > LEAK DETECTION > START TEST

2 - Ensure that indoor blower, outdoor fan, and combustion air blower (LGT only) are energized.

#### **Cooling Start-Up**

#### A-Operation

1 - Initiate full load cooling operation using the following mobile service app menu path:

#### RTU MENU > COMPONENT TEST > COOLING > COOLING STAGE 2

NOTE - Refer to Cooling Operation section for high efficiency unit operation in zone sensor mode.

- 2 Units contain one refrigerant circuit or stage.
- 3 Unit is charged with R-454B refrigerant. See unit rating plate for correct amount of charge.
- 4 Refer to Cooling Operation and Adjustment section for proper method to check refrigerant charge.

#### B-Refrigerant Charge and Check - All-Aluminum Coil WARNING - Do not exceed nameplate charge under any condition.

This unit is factory charged and should require no further adjustment. If the system requires additional refrigerant, *reclaim the charge*, *evacuate the system*, and *add required nameplate charge*.

Refrigerant Charge R-454B									
Unit	M _c (lbs)	M _c (kg)

LGX/LCX036 W/ Humidtrol	4.64	2.10							
LGX/LCX048 W/ Humidtrol	4.24	1.92							
LGX/LCX060 W/ Humidtrol	4.76	2.16							
LGX/LCX072 W/ Humidtrol	4.5	2.04							

In addition to conventional charging procedures, the following requirements shall be followed.

- Ensure that contamination of different refrigerants does not occur when using charging equipment. Hoses or lines shall be as short as possible to minimize the amount of refrigerant contained in them.
- Cylinders shall be kept in an appropriate position according to the instructions.
- Ensure that the unit is earth grounded prior to charging the system with refrigerant.

- Label the system when charging is complete (if not already).
- Extreme care shall be taken not to overfill the unit.

Prior to recharging the system, it shall be pressuretested with the appropriate purging gas. The system shall be leak-tested on completion of charging but prior to commissioning. A follow up leak test shall be carried out prior to leaving the site.

- When removing refrigerant from a system, either for servicing or decommissioning, it is recommended good practice that all refrigerants are removed safely.
- When transferring refrigerant into cylinders, ensure that only appropriate refrigerant recovery cylinders are employed. Ensure that the correct number of cylinders for holding the total system charge is available. All cylinders to be used are designated for the recovered refrigerant and labelled for that refrigerant (i. e. special cylinders for the recovery of refrigerant). Cylinders shall be complete with pressure-relief valve and associated shut-off valves in good working order. Empty recovery cylinders are evacuated and, if possible, cooled before recovery.
- The recovery equipment shall be in good working order with a set of instructions concerning the equipment that is at hand and shall be suitable for the recovery of all appropriate refrigerants including, when applicable, flammable refrigerants. In addition, a set of calibrated weighing scales shall be available and in good working order. Hoses shall be complete with leak-free disconnect couplings and in good condition. Before using the recovery machine, check that it is in satisfactory working order, has been properly maintained and that any associated electrical components are sealed to prevent ignition in the event of a refrigerant release. Consult manufacturer if in doubt.
- The recovered refrigerant shall be returned to the refrigerant supplier in the correct recovery cylinder, and the relevant waste transfer note arranged. Do not mix refrigerants in recovery units and especially not in cylinders.
- If compressors or compressor oils are to be removed, ensure that they have been evacuated to an acceptable level to make certain that flammable refrigerant does not remain within the lubricant. The evacuation process shall be carried out prior to returning the compressor to the suppliers. Only electric heating to the compressor body shall be employed to accelerate this process. When oil is drained from a system, it shall be carried out safely.

**NOTE -** System charging is not recommended below  $60^{\circ}F$  (15°C). In temperatures below  $60^{\circ}F$  (15°C), the charge must be weighed into the system.

If weighing facilities are not available, or to check the charge, use the following procedure:

- Make sure outdoor coil is clean. Attach gauge manifolds and operate unit at full CFM in cooling mode with economizer disabled until system stabilizes (approximately five minutes). Make sure all outdoor air dampers are closed.
- 2 Compare the normal operating pressures to the pressures obtained from the gauges. Check unit components if there are significant differences.
- 3 Measure the outdoor ambient temperature and the suction pressure. Refer to the charging curve to determine a target liquid temperature.

**NOTE -** Pressures are listed for sea level applications.

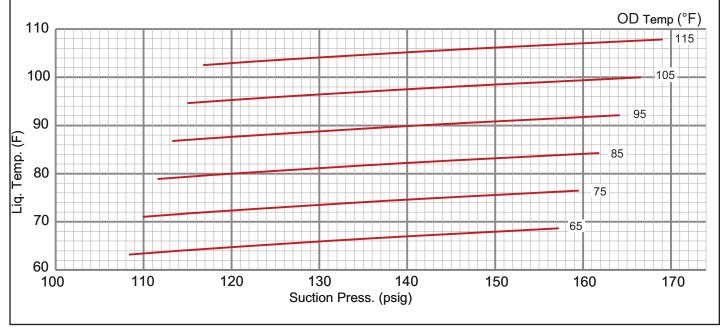

- 4 Use the same thermometer to accurately measure the liquid temperature (in the outdoor section).
- If measured liquid temperature is higher than the target liquid temperature, add refrigerant to the system.
- If measured liquid temperature is lower than the target liquid temperature, recover some refrigerant from the system.

- 5 Add or remove charge in increments. Allow the system to stabilize each time refrigerant is added or removed.
- 6 Continue the process until measured liquid temperature agrees with the target liquid temperature. Do not go below the target liquid temperature when adjusting charge. Note that suction pressure can change as charge is adjusted.
- 7 Example: For the 024 model, at 95°F outdoor ambient and a measured suction pressure of 130psig, the target liquid temperature is 89°F.
   For a measured liquid temperature of 106°F, add charge in increments until measured liquid temperature agrees with the target liquid temperature.

072 CHARGING CURVE - REHEAT - ALL-ALUMINUM COIL - 581237-01

#### **C-Compressor Controls**

See unit wiring diagram to determine which controls are used on each unit. Optional controls are identified on wiring diagrams by arrows at junction points.

1 - High Pressure Switch (S4)

The compressor circuit is protected by a high pressure switch which opens at 640 psig + 10 psig (4413 kPa  $\pm$  70 kPa) and automatically resets at 475 psig  $\pm$  20 psig (3275kPa  $\pm$  138 kPa).

2 - Low Pressure Switch (S87)

The compressor circuit is protected by a loss of charge switch. Switch opens at 40 psig  $\pm$  5 psig (276  $\pm$  34 kPa) and automatically resets at 90 psig  $\pm$  5 psig (621 kPa  $\pm$  34 kPa).

3 - Diagnostics Sensors (RT46, RT48)

Two thermistors are located on specific points in the refrigeration circuit. The thermistors provide constant temperature feedback to the Unit Controller to protect the compressor. Thermistors take the place of the freezestat and low ambient pressure switch.

4 - Compressor Crankcase Heater (HR1)

Crankcase heater must be energized at all times to prevent compressor damage due to refrigerant migration. Energize crankcase heater 24 hours before unit start-up by setting thermostat so that there is no cooling demand (to prevent compressor from cycling) and apply power to unit.

## **Diagnostic Sensors**

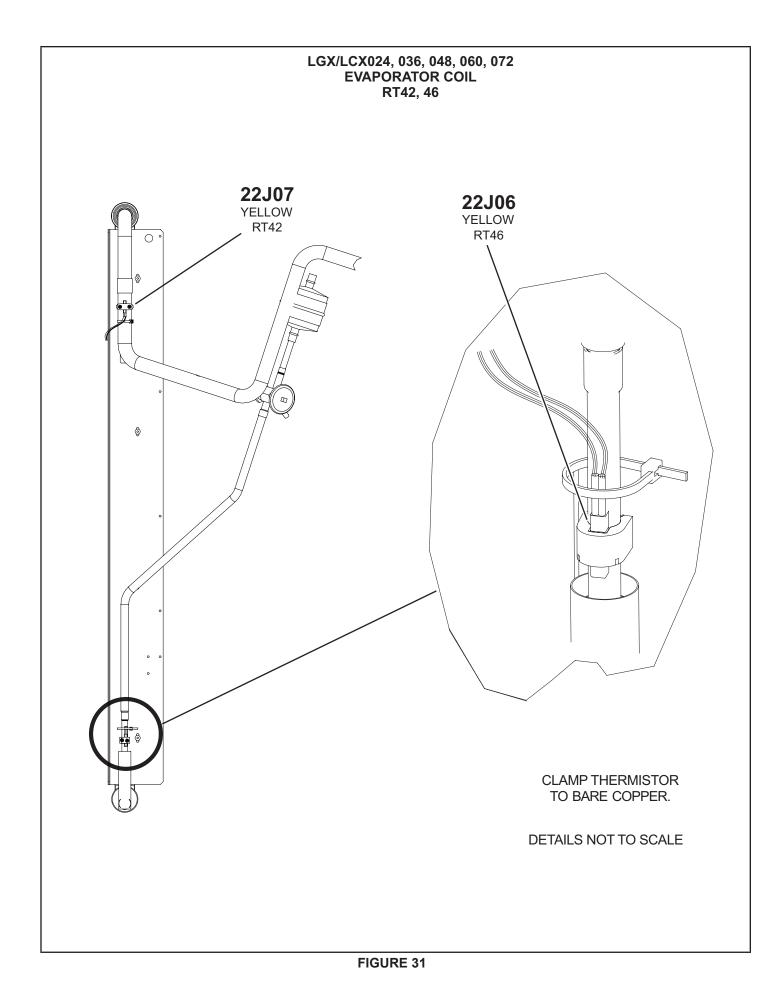

Units are equipped with three factory-installed thermistors (RT46 and RT48) located on different points on the refrigerant circuit.

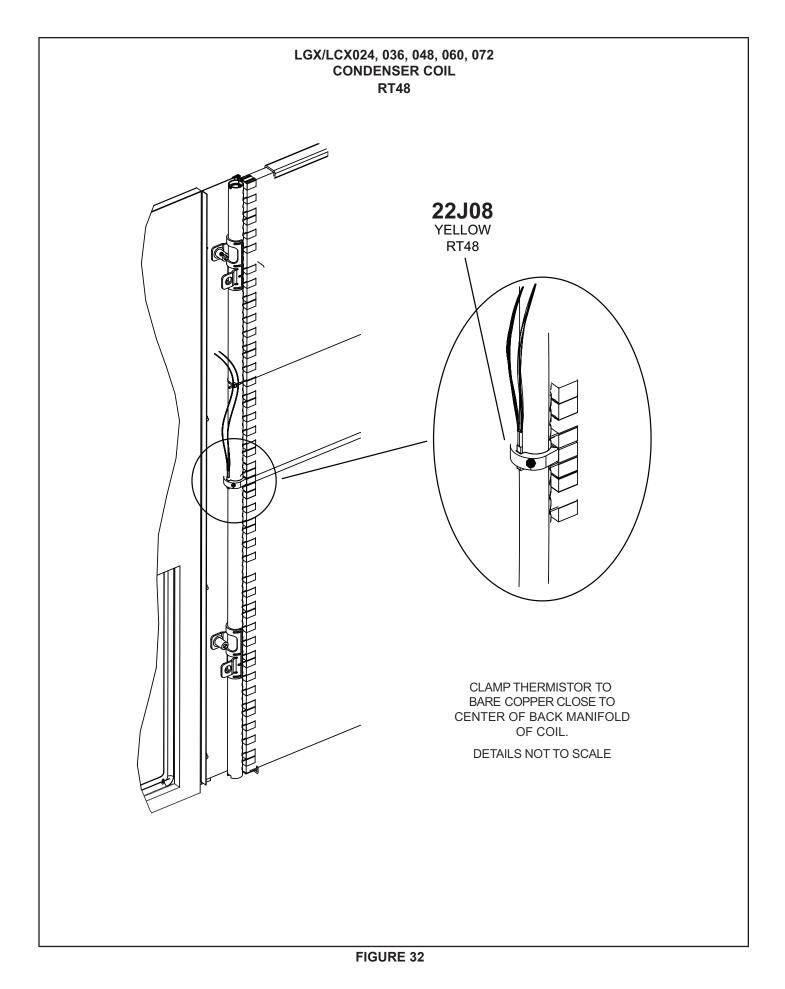

The thermistors provide the Unit Controller with constant temperature readings of two specific locations on the refrigeration circuit. These temperatures are used as feedback in certain modes of unit operation. In addition, the Unit Controller uses these temperatures to initiate alarms such as loss of condenser or evaporator airflow and loss of charge.

Each thermistor must be specifically placed for proper unit operation and to initiate valid alarms. See TABLE 13 for proper locations.

LGX/LCX024, 036, 048, 060, 072	RT48	FIGURE 32								

### **RDS Sensors**

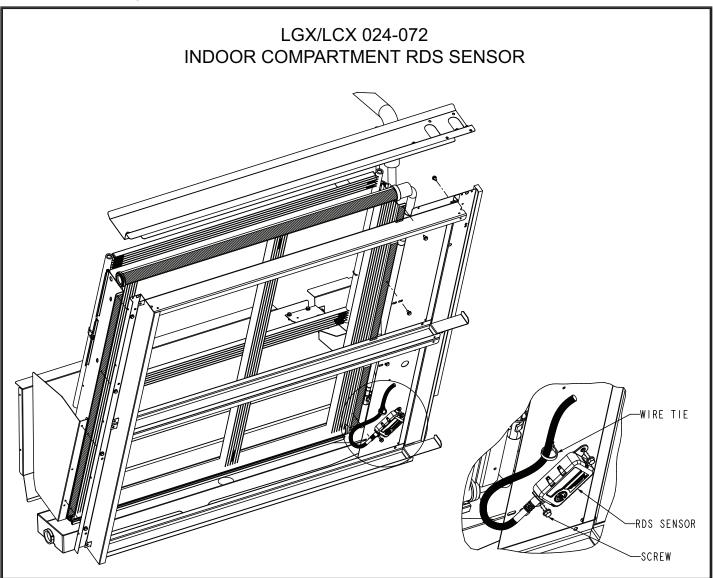

Units are equipped with factory-installed RDS Sensors located on different points on the unit. The RDS sensors provide the Unit Controller with continuous readings for leaked refrigerant concentration levels and sensor health status (Good or Fault). These readings are used to modify unit operation to disperse the leaked refrigerant and to remove possible ignition sources. In addition, the Unit Controller uses these readings to initiate alarms to alert the operator of a refrigerant leak or faulty sensor(s).

Each sensor must be specifically placed for proper unit operation and to initiate valid alarms. To identify sensor locations see TABLE 16.

## Gas Heat Start-Up (Gas Units)

## FOR YOUR SAFETY READ BEFORE LIGHTING

## A WARNING

Electric shock hazard. Can cause injury or death. Do not use this unit if any part has been under water. Immediately call a qualified service technician to inspect the unit and to replace any part of the control system and any gas control which has been under water.

# A WARNING

Danger of explosion. Can cause injury or product or property damage. If over heating occurs or if gas supply fails to shut off, shut off the manual gas valve to the appliance before shutting off electrical supply.

# A WARNING

Electric shock hazard. Can cause injury or death. Before attempting to perform any service or maintenance, turn the electrical power to unit OFF at disconnect switch(es). Unit may have multiple power supplies.

## A WARNING **SMOKE POTENTIAL**

The heat exchanger in this unit could be a source of smoke on initial firing. Take precautions with respect to building occupants and property. Vent initial supply air outside when possible.

BEFORE LIGHTING smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

The gas valve may be equipped with either a gas control lever or gas control knob. Use only your hand to push the lever or turn the gas control knob. Never use tools. If the the lever will not move or the knob will not push in or turn by hand, do not try to repair it. Call a qualified service technician. Force or attempted repair may result in a fire or explosion.

## **A** WARNING

Danger of explosion. Can cause injury or death. Do not attemptr to light manually. Unit has a direct spark ignition system.

This unit is equipped with an automatic spark ignition system. There is no pilot. In case of a safety shutdown, move thermostat switch to OFF and return the thermostat switch to **HEAT** to reset ignition control.

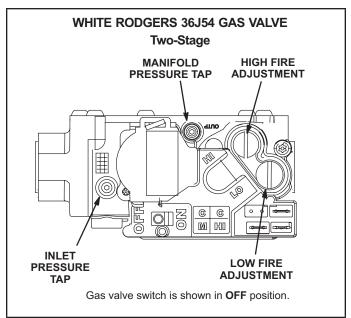

### A-Placing Unit In Operation

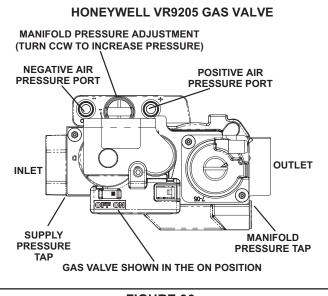

Danger of explosion and fire. Can cause injury or product or property damage. You must follow these instructions exactly.

### Gas Valve Operation (FIGURE 35 and 24)

- 1 Set thermostat to lowest setting.
- 2 Turn off all electrical power to appliance.
- 3 This appliance is equipped with an ignition device which automatically lights the burner. Do not try to light the burner by hand.
- 4 Open or remove the control access panel.
- 5 Move gas valve switch to OFF. See FIGURE 35 or FIGURE 36.

**FIGURE 35** 

**FIGURE 36** 

Page 49

Wait five (5) minutes to clear out any gas. If you then smell gas, **STOP!** Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions. If you do not smell gas, go to the next step.

- 6 Move gas valve switch to **ON**. See FIGURE 35 or FIGURE 36.
- 7 Close or replace the control access panel.
- 8 Turn on all electrical power to appliance.
- 9 Set thermostat to desired setting.

## **NOTE -** When unit is initially started, steps 1 through 9 may need to be repeated to purge air from gas line.

- 10 The ignition sequence will start.
- 11 If the furnace does not light the first time (gas line not fully purged), it will attempt up to two more ignitions before locking out.
- 12 If lockout occurs, repeat steps 1 through 10.
- 13 If the appliance will not operate, follow the instructions "Turning Off Gas to Appliance" and call your service technician or gas supplier.

#### **Turning Off Gas to Unit**

- 1 If using an electromechanical thermostat, set to the lowest setting.
- 2 Before performing any service, turn off all electrical power to the appliance.
- 3 Open or remove the control access panel.
- 4 Move gas valve switch to OFF.
- 5 Close or replace the control access panel.

## A WARNING

Danger of explosion. Can cause injury or death. Do not attempt to light manually. Unit has a direct spark ignition system.

### **Heating Operation and Adjustments**

#### (Gas Units)

#### **A-Heating Sequence of Operation**

#### **Two-Stage**

- 1 On a heating demand the combustion air inducer starts immediately.
- 2 Combustion air pressure switch proves inducer operation. After a 30-second pre-purge, power is allowed to ignition control. Switch is factory set and requires no adjustment.
- 3 Spark ignitor energizes and gas valve solenoid opens.
- 4 Spark ignites gas, ignition sensor proves the flame and combustion continues.
- 5 If flame is not detected after 8 seconds, the ignition control will repeat steps 3 and 4 two more times. The ignition control will wait 5 minutes before the ignition attempt recycles.

#### **B-Ignition Control Diagnostic LEDs**

#### TABLE 14 IGNITION CONTROL HEARTBEAT LED STATUS

LED Flashes	Indicates
Steady Off	No power or control hardware fault.
Steady Off	Power applied. Control OK.
3 Flashes	Ignition lockout from too many trials.
4 Flashes	Ignition lockout from too many flame losses within single call for heat.
5 Flashes	Control hardware fault detected.

#### **C-Limit Controls**

Limit controls are factory-set and are not adjustable. The primary limit is located to the right of the combustion air inducer. See FIGURE 43.

#### **D-Heating Adjustment**

#### Non ULNOx Units

Main burners are factory-set and do not require adjustment.

The following manifold pressures are listed on the gas valve.

Natural Gas Units - Low Fire - 2.0" w.c.

Natural Gas Units - High Fire - 3.5" w.c.

LP Gas Units - Low Fire - 5.9" w.c.

LP Gas Units - High Fire - 10.5" w.c.

Manifold Pressure - ULNOx Units

Use the following steps to correctly measure manifold pressure:

- Remove the threaded plug from the outlet side of the gas valve and install a field-provided barbed fitting. Connect measuring device "+" connection to barbed fitting to measure manifold pressure. Start unit and allow 15 minutes for unit to reach steady state.
- 2 After allowing unit to stabilize for 15 minutes, record manifold pressure and compare to value given in table 15. Normally manifold adjustment is not necessary; adjust manifold only if needed.
- 3 Shut unit off and remove manometer as soon as an accurate reading has been obtained.

TABLE 15 ULNOX Manifold Pressure (in.w.c.)					
High Fire 3.2-3.6					
Low Fire	1.7-2.1				

#### Proper Combustion - ULNOx Units

Restart unit and check for any gas leaks. Seal any leaks if found. Furnace should operate minimum 15 minutes with correct manifold pressure and gas flow rate before checking combustion. Table 16 shows acceptable combustion. The maximum carbon monoxide reading should not exceed 100 ppm.

TABLE 16       CO ₂ Rates (ppm)						
High Fire	6.0-7.5					
Low Fire	6.0-7.5 (CO ₂ tracks)					

#### **E-ULNOx Operation**

ULNOx units are not equipped with gas orifices that supply each burner. Instead, a single gas orifice supplies gas to the air/gas elbow. An intake air orifice supplies combustion air to the air/gas elbow. The combustion air blower draws the air/gas mixture from the air/gas elbow into the air/gas plenum box. When the spark ignites the gas, the ignition sensor proves the flame and combustion occurs in the burner premix plate. The burner box liner directs the flames into the burner tube sleeves. Refer to FIGURE 43.

## Electric Heat Start-Up (LCX Units)

Optional electric heat will stage on and cycle with thermostat demand. See electric heat wiring diagram on unit for sequence of operation.

### Hot Gas Reheat Start-Up and Operation

Hot gas reheat units provide a dehumidifying mode of operation. These units contain a reheat coil adjacent to and downstream of the evaporator coil. Reheat coil solenoid valve, L14, routes hot discharge gas from the compressor to the reheat coil. Return air pulled across the evaporator coil is cooled and dehumidified; the reheat coil adds heat to supply air. See FIGURE 37 for reheat refrigerant routing and FIGURE 38 for standard cooling refrigerant routing.

#### L14 Reheat Coil Solenoid Valve

When Unit Controller input (Unit Controller J298-5 or J299-8) indicates room conditions require dehumidification, L14 reheat valve is energized (Unit Controller P269-3) and refrigerant is routed to the reheat coil.

#### **Reheat Setpoint**

Reheat is factory-set to energize when indoor relative humidity rises above 60% (default). The reheat setpoint can be adjusted by changing mobile service app Settings

- *Control* menu. A setting of 100% will operate reheat from an energy management system digital output. The reheat setpoint can also be adjusted using an optional Network Control Panel (NCP).

Reheat will terminate when the indoor relative humidity falls 3% (57% default) or the digital output de-energizes. The reheat deadband can be adjusted at Settings - Control menu.

#### Check-Out

Test reheat operation using the following procedure.

- 1 Make sure reheat is wired as shown in wiring section.
- 2 Make sure unit is in local thermostat mode.
- 3 Use mobile service app menu path to select:

#### RTU MENU > COMPONENT TEST > DEHUMIDIFICATION

The blower, compressor, and reheat valve should be energized. Pressure can be checked on the reheat line pressure tap. Pressure on the reheat line should match discharge pressure closely in reheat mode.

#### **Default Reheat Operation**

During reheat mode free cooling is locked out.

No Y1 demand but a call for dehumidification:

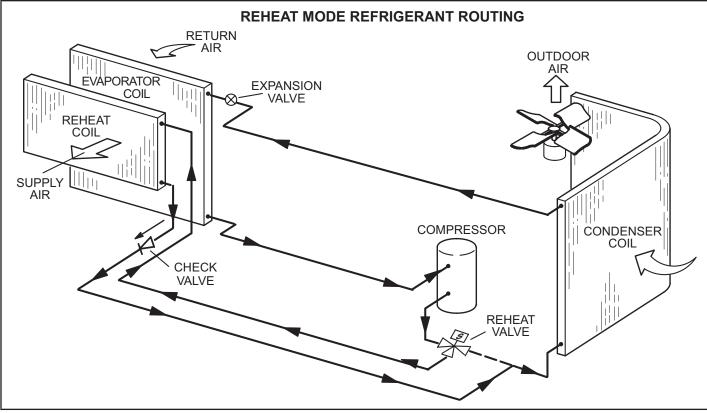

Compressor is operating, blower is on, and the reheat valve is energized.

Y1 demand:

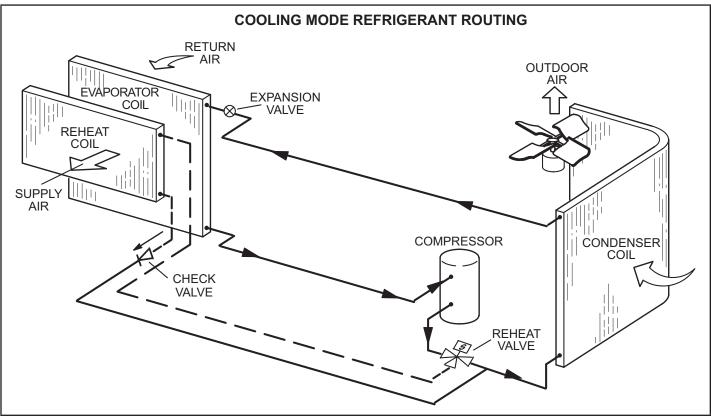

Compressor is operating, blower is on, and the reheat valve is de-energized.

Y2 demand:

Compressor is operating, blower is on, and the reheat valve is de-energized.

**FIGURE 37** 

**FIGURE 38** 

#### **Preventative Maintenance / Repair**

#### IMPORTANT MAINTENANCE / REPAIR SAFETY INSTRUCTIONS

Prior to beginning work on systems containing FLAMMABLE REFRIGERANTS, safety checks are necessary to ensure that the risk of ignition is minimized.

Work shall be undertaken under a controlled procedure to minimize the risk of a flammable gas or vapor being present while the work is being performed.

All maintenance staff and others working in the local area shall be instructed on the nature of work being carried out. Work in confined spaces shall be avoided.

The area shall be checked with an appropriate refrigerant detector prior to and during work, to ensure the technician is aware of potentially toxic or flammable atmospheres. Ensure that the leak detection equipment being used is suitable for use with all applicable refrigerants, i.e. nonsparking, adequately sealed or intrinsically safe.

If any hot work is to be conducted on the refrigerating equipment or any associated parts, appropriate fire extinguishing equipment shall be available to hand. Have a dry powder or CO2 fire extinguisher adjacent to the charging area.

No person carrying out work in relation to a REFRIGERATING SYSTEM which involves exposing any pipe work shall use any sources of ignition in such a manner that it may lead to the risk of fire or explosion. All possible ignition sources, including cigarette smoking, should be kept sufficiently far away from the site of installation, repairing, removing and disposal, during which refrigerant can possibly be released to the surrounding space. Prior to work taking place, the area around the equipment is to be surveyed to make sure that there are no flammable hazards or ignition risks. "No Smoking" signs shall be displayed.

Where electrical components are being changed, they shall be fit for the purpose and to the correct specification. At all times, the manufacturer's maintenance and service guidelines shall be followed. If in doubt, consult the manufacturer's technical department for assistance.

The following checks shall be applied to installations using FLAMMABLE REFRIGERANTS:

 the actual REFRIGERANT CHARGE is in accordance with the room size within which the refrigerant

containing parts are installed;

the ventilation machinery and outlets are operating adequately and are not obstructed;

 if an indirect refrigerating circuit is being used, the secondary circuit shall be checked for the presence of refrigerant;

 marking to the equipment continues to be visible and legible. Markings and signs that are illegible shall be corrected;

 refrigerating pipe or components are installed in a position where they are unlikely to be exposed to any substance which may corrode refrigerant containing components, unless the components are constructed of materials which are inherently resistant to being corroded or are suitably protected against being so corroded.

During repairs to sealed electrical components, the components shall be replaced. Replacement parts shall be in accordance with the manufacturer's specifications.

During repairs to intrinsically safe components, the components must be replaced. Replace components only with parts specified by the manufacturer. Other parts may result in the ignition of refrigerant in the atmosphere from a leak.

The unit should be inspected once a year by a qualified service technician.

## **WARNING**

Electric shock hazard. Can cause injury or death. Before attempting to perform any service or maintenance, turn the electrical power to unit OFF at disconnect switch(es). Unit may have multiple power supplies.

## 

Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Verify proper operation after servicing.

#### **A-Filters**

Units are equipped with temporary filters which must be replaced prior to building occupation. Use four 20 X 20 X 2" (508 X 508 X 51mm) filters. Refer to local codes or appropriate jurisdiction for approved filters.

# A WARNING

Units are shipped from the factory with temporary filters. Replace filters before building is occupied. Damage to unit could result if filters are not replaced with approved filters. Refer to appropriate codes.

Approved filters should be checked monthly and replaced when necessary. Take note of air flow direction marking on filter frame when reinstalling filters. See FIGURE 39.

**NOTE -** Filters must be U.L.C. certified or equivalent for use in Canada.

#### **B-Lubrication**

All motors are lubricated at the factory. No further lubrication is required.

#### **C-Burners**

Note - ULNOx units use a burner premix plate and a burner box liner with three burner tube sleeves instead of burners. No examination or cleaning are required. See figure 31.

Periodically examine burner flames for proper appearance during the heating season. Before each heating season examine the burners for any deposits or blockage which may have occurred.

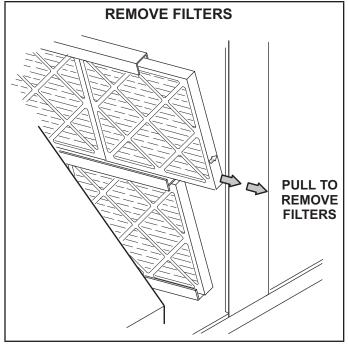

FIGURE 39

Clean burners as follows:

- 1 Turn off both electrical power and gas supply to unit.
- 2 Remove blower access panel.
- 3 Remove top burner box panel.
- 4 Remove screws securing burners to burner support and lift the individual burners or the entire burner assembly from the orifices. See FIGURE 40. Clean as necessary.
- 5 Locate the ignitor under the right burner. Check ignitor spark gap with appropriately sized twist drills or feeler gauges. See FIGURE 41.
- 6 Replace burners and screws securing burner. See FIGURE 40.

## A WARNING

Danger of explosion. Can cause injury or death. Do not overtighten main burner mounting screws. Snug tighten only.

- 7 Replace access panel.
- 8 Restore electrical power and gas supply. Follow lighting instructions attached to unit and use inspection port in access panel to check flame.

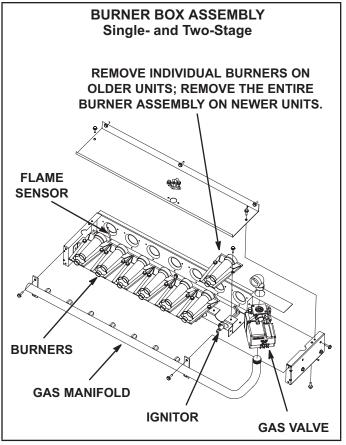

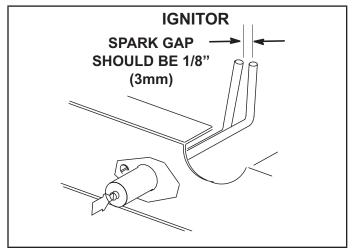

FIGURE 40

**FIGURE 41** 

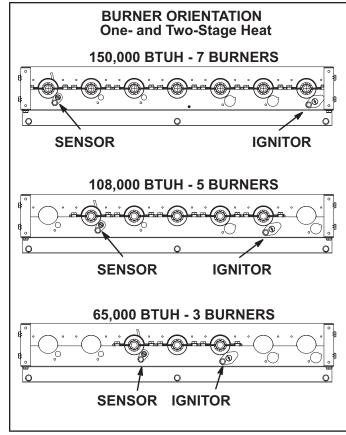

FIGURE 42

#### D-Combustion Air Inducer (Gas Units)

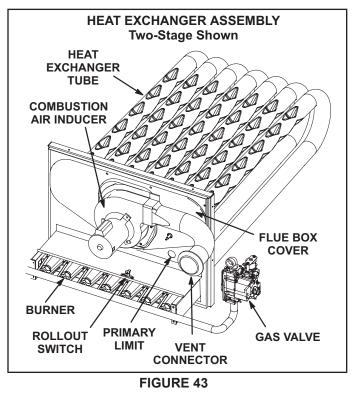

A combustion air proving switch checks combustion air inducer operation before allowing power to the gas controller. Gas controller will not operate if inducer is obstructed.

Under normal operating conditions, the combustion air inducer wheel should be checked and cleaned prior to the heating season. However, it should be examined periodically during the heating season to establish an ideal cleaning schedule.

Clean combustion air inducer as follows:

- 1 Shut off power supply and gas to unit.
- 2 Remove the mullion on the right side of the heat section.
- 3 Disconnect pressure switch air tubing from combustion air inducer port.
- Remove and retain screws securing combustion air inducer to flue box. Remove vent connector. See FIGURE 38.
- 5 Clean inducer wheel blades with a small brush and wipe off any dust from housing. Take care not to damage exposed fan blades. Clean accumulated dust from front of flue box cover.
- 6 Return combustion air inducer motor and vent connector to original location and secure with retained screws. It is recommended that gaskets be replaced during reassembly.

- 7 Replace mullion.
- 8 Clean combustion air inlet louvers on blower access panel using a small brush.

#### E-Flue Box (Gas Units)

Remove flue box cover only when necessary for equipment repair. Clean inside of flue box cover and heat exchanger tubes with a wire brush when flue box cover has to be removed. Install a new flue box cover gasket and replace cover. Make sure edges around flue box cover are tightly sealed.

#### **F-Evaporator Coil**

Inspect and clean coil at beginning of each cooling season. Clean the all-aluminum coil by spraying the coil steadily and uniformly from top to bottom. Do not exceed 900 psi or a 45° angle; nozzle must be at least 12 inches from the coil face. Take care not to fracture the braze between fins and refrigerant tubes. Reduce pressure and work cautiously to prevent damage. Flush condensate drain with water, taking care not to get insulation, filters, and return air ducts wet through entire cleaning process.

#### **G-Condenser Coil**

Clean condenser coil annually with water and inspect monthly during the cooling season.

Clean the all-aluminum coil by spraying the coil steadily and uniformly from top to bottom. Do not exceed 900 psi or a 45° angle; nozzle must be at least 12 inches from the coil face. Take care not to fracture the braze between the fins and refrigerant tubes. Reduce pressure and work cautiously to prevent damage.

#### H-Supply Air Blower Wheel

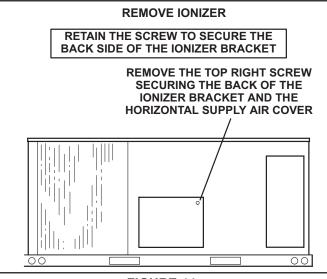

Annually inspect supply air blower wheel for accumulated dirt or dust. Turn off power before attempting to remove access panel or to clean blower wheel.

#### J-Needlepoint Bipolar Ionizer (Optional)

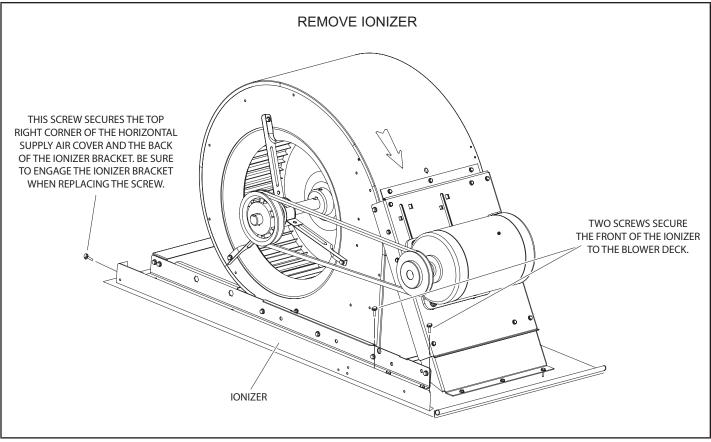

The optional, brush-type ionizer produces positive and negative ions to clean air and reduce airborne contaminants. The ionizer was designed to be low maintenance. The device should be checked semiannually to confirm the brushes are clean for maximum output. The ionizer is located behind on the blower deck to the left of the blower. See FIGURE 45.

- On the back side of the unit, remove the screw securing the back of the ionizer bracket. See FIGURE 44. Retain the screw to secure the back side of the ionizer bracket.
- 2 Remove two screws securing the front side of the ionizer bracket and pull out of unit and clean brushes.

Replace ionizer in the reverse order it was removed.

**FIGURE 44** 

**FIGURE 45** 

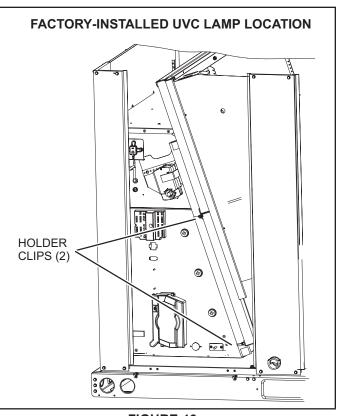

### K-UVC Light (Optional)

When field-installed, use only UVC Light Kit assembly 106881-01 (21A92) with this appliance.

#### Factory-Installed UVC Light

When the UVC light is factory installed, the lamp is shipped attached to the filter rack. Remove the lamp and install into the UVC light assembly as shown in steps 2 through 11.

1 - Cut wire ties and remove the UVC lamp attached to the filter rack. See FIGURE 46.

**FIGURE 46** 

# A WARNING

Personal Burn Hazard.

Personal injury may result from hot lamps. During replacement, allow lamp to cool for 10 minutes before removing lamp from fixture.

The lamp should be replaced every 12 months, as UVC energy production diminishes over time.

- 1 Obtain replacement lamp 102337-01 for your germicidal light model.
- 2 Disconnect power to the rooftop unit before servicing the UVC kit.
- 3 Open the blower access door.
- 4 Remove the screw in wire tie from the UVC assembly and disconnect the 4-pin connector from the lamp end.
- 5 Remove the (2) mounting screws of the UVC assembly. Carefully slide the complete UVC assembly out through the blower access door.
- 6 Allow 10 minutes before touching the lamps. Then, carefully remove the old lamp from the lamp holder clips.
- 7 Wear cotton gloves or use a cotton cloth when handling the new lamp. Place the new lamp in the holder clips of the UVC assembly. Verify that the lamp flange at the connector end is sandwiched between the lamp holder clip and the sheet-metal end stop (see FIGURE 47).
- 8 Carefully place the UVC assembly on the blower deck. Line up the mounting holes on the UVC assembly with the mounting holes on the blower deck. See FIGURE 48. Use the #10 screws provided to attach the UVC assembly in place.
- 9 Make sure to reapply the black convoluted tubing used to shield electrical wiring in the rooftop unit. Convoluted tubing is provided when the ionizer is factory- or field-installed. However, if there is any concern, aluminum foil tape (not provided) can also be used to cover any exposed component.
- 10 Close the blower access door.
- 11 Reconnect power to the rooftop unit.
- 12 Open the filter access door and look through the view port in the triangular sheet-metal panel to verify that the UVC light is on.

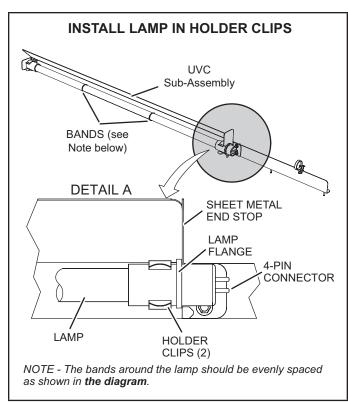

FIGURE 47

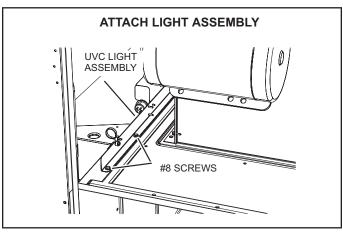

FIGURE 48

#### Lamp Disposal

**Hg-LAMP Contains Mercury** - Manage in accordance with local, state, and federal disposal laws. Refer to www. lamprecycle.org or call 800-953-6669.

#### Proper Clean-up Technique in Case of Lamp Breakage

Wear protective gloves, eye wear and mask.

Sweep the broken glass and debris into a plastic bag, seal the bag, and dispose of properly. Contact your local waste management office for proper disposal.

#### Do not use a vacuum cleaner. Do not incinerate.

#### Maintenance

- For all maintenance, contact a qualified HVAC technician.
- Read the maintenance instructions before opening unit panels.
- Unintended use of the unit or damage to the unit housing may result in the escape of dangerous UVC radiation. UVC radiation may, even in small doses, cause harm to the eyes and skin.
- Do not operate units that are obviously damaged.
- Do not discard the triangular UVC light shield or any barriers with an ultraviolet radiation symbol.
- Do not override the door interlock switch that interrupts power to the UVC light.

Do not operate the UVC light outside of the unit.M-

#### **Replacement Fuses**

See the following tables for the proper replacement fuse sizes.

ELECTRIC HEAT REPLACEMENT FUSES									
	Electric Heat	011	Rating						
	Electric Heat	Qty.	Amp	Volt					
1	E1EH0050N-1P	2	30	250

## **Factory Unit Controller Settings**

Use the mobile service app to adjust parameters; menu paths are shown in each table. Refer to the Unit Controller manual provided with each unit.

TABLE 17 through TABLE 19 show factory settings (in degrees, % of fan CFM, etc.). Record adjusted settings on the label located inside the compressor access panel.

When field installing optional kits and accessories, the Unit Controller must be configured to identify the option before it will function. Refer to FIGURE 49 and FIGURE 50 to determine whether the Unit Controller configuration I.D. must change. To configure the option, use MAIN MENU > SETUP > INSTALL menu path. Press SAVE until CONFIGURATION ID 1 or 2 appears depending on the option installed. Change the appropriate character in the configuration I.D. For example, when an economizer is installed using a single enthalpy sensor, change configuration I.D. 1, the second character, to "S".

### Decommissioning

Before carrying out this procedure, it is essential that the technician is completely familiar with the equipment and all its detail. It is recommended good practice that all refrigerants are recovered safely.

Prior to the task being carried out, an oil and refrigerant sample shall be taken in case analysis is required prior to re-use of recovered refrigerant. It is essential that electrical power is available before starting decommissioning.

- a) Become familiar with the equipment and its operation.
- b) Isolate system electrically.
- c) Before attempting the procedure, ensure that:
  - mechanical handling equipment is available, if required, for handling refrigerant cylinders;
  - all personal protective equipment is available and being used correctly;
  - the recovery process is supervised at all times by a competent person;
  - recovery equipment and cylinders conform to the appropriate standards.

d) Pump down refrigerant system, if possible.

e) If a vacuum is not possible, make a manifold so that refrigerant can be removed from various parts of the system.

f) Make sure that cylinder is situated on the scales before recovery takes place.

g) Start the recovery machine and operate in accordance with instructions.

h) Do not overfill cylinders (no more than 80% volume liquid charge).

i) Do not exceed the maximum working pressure of the cylinder, even temporarily.

j) When the cylinders have been filled correctly and the process completed, make sure that the cylinders and the equipment are removed from site promptly and all isolation valves on the equipment are closed off.

 k) Recovered refrigerant shall not be charged into another REFRIGERATING SYSTEM unless it has been cleaned and checked.

## **MIMPORTANT**

Equipment shall be labelled stating that it has been decommissioned and emptied of refrigerant. The label shall be signed and dated. Ensure that there are labels on the equipment that state the flammability of the refrigerant used.
